

Frog Blog Presentation

December 2025

Meet the team

Miguel

Frontend

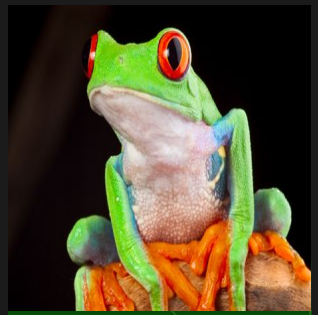

-React components and UI/UX
-Client-side routing with React Router
-Integration with backend APIs
-Awesome logo

Melody

Backend

-Express implementation
-Authentication using BetterAuth
-Implementation of the posting and profile system

Julian

Front/Backend

-Implementation of posts

What is Frog Blog?

Frog Blog is a blog platform where users can create accounts, write blog posts, and share stories or pictures online with a community. Ribbit.

Why are we making this?

Our motivation for developing Frog Blog is so that we as students learn how to work with one another as a team to develop something practical in the real world. In this case, a full-stack project making a blogging site.

What's different about our site compared to all the rest on the internet is really just the name and theme. We are reinventing the wheel with this, but the main purpose behind it is to further develop our skills as developers.

Tech Stack - Frontend

01

React

UI Framework

02

Vite

Build tool & dev server

03

React Router

Client-side routing

04

CSS

Custom styling

Tech Stack - Backend

01

MongoDB

Database

02

Node.js

Runtime environment

03

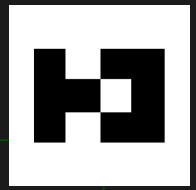

Express

Web Framework

Typescript

Type-safe development

Better Auth

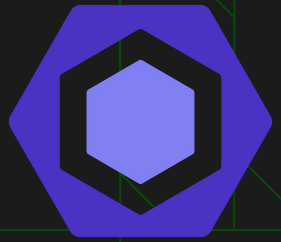

Authentication system

Tech Stack - Development Tools

tsx

TypeScript execution

ESLint

Code linting

Git/GitHub

Version control

npm

Package management

The Features

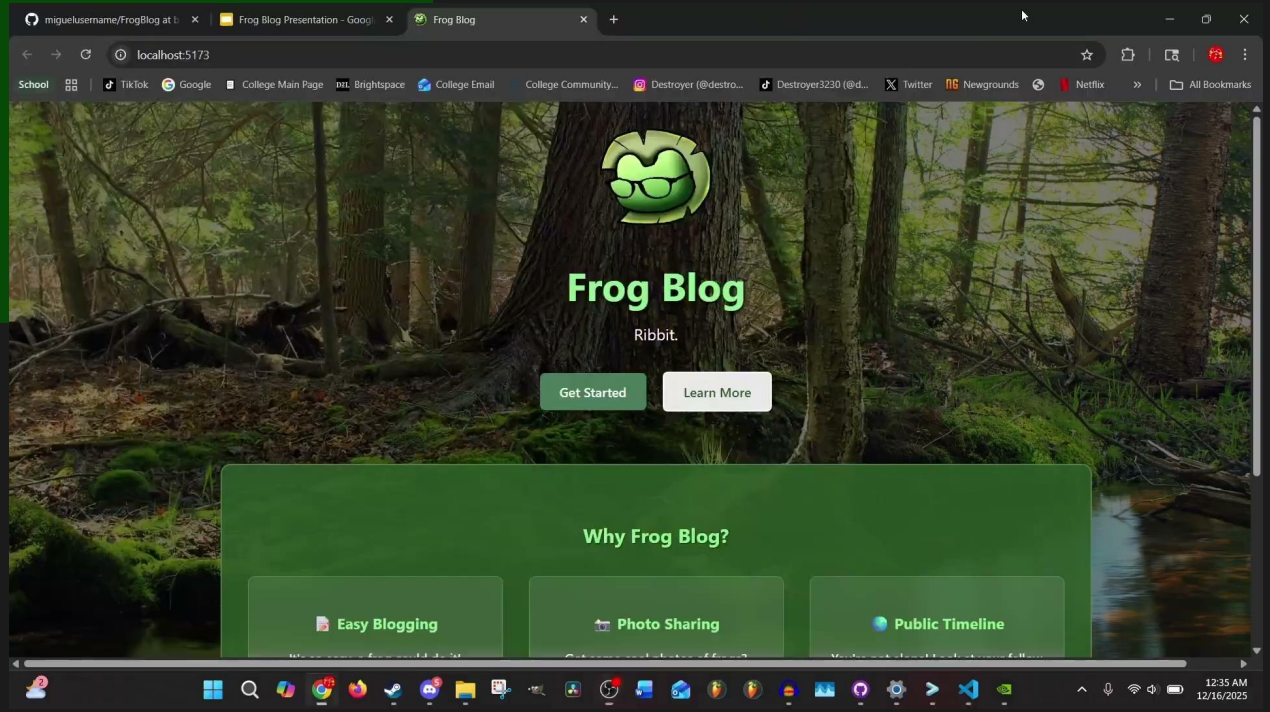

- Registration
- Login
- Create posts
- Profile Pages
- etc.

The endpoints

- /login
- /register
- /post
- /posts
- /profile

Challenges

Like with any project, we ran into troubles. We had difficulty getting Mongo to work, had some endpoint mismatching, and slight merge conflicts (nothing major).

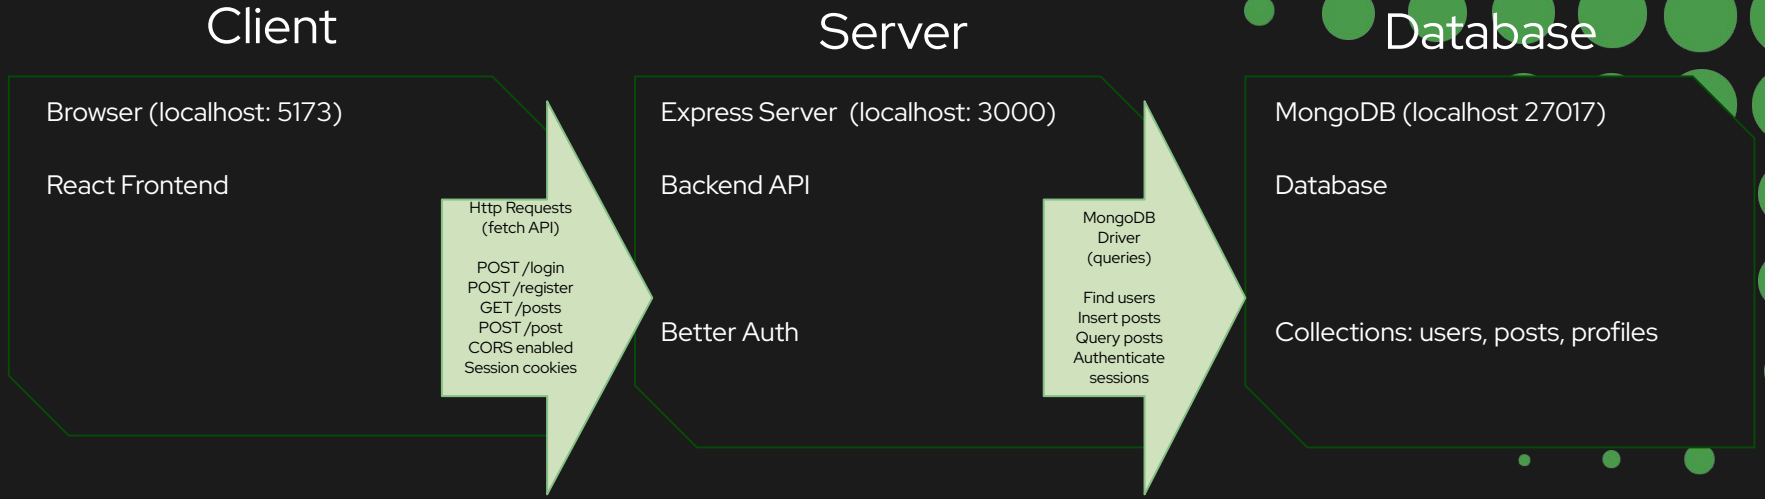

Future Work

If we were to continue working on Frog Blog, we could finish/implement features such as:

- Edit posts
- Comments
- Like posts
- So much more!

And even deploy the site!

Architecture

Thank you

Questions?
